

Prostate Cancer Genomic Assay (Prolaris™)

Date of Origin: 02/28/2018

Last Review Date: 03/24/2021

Effective Date: 04/01/2021

Dates Reviewed: 03/2018, 03/2019, 03/2020, 03/2021

Developed By: Medical Necessity Criteria Committee

I. Description

Prolaris™ is an RNA based assay measuring the expression of 31 cell cycle progression (CCP) genes and 15 “housekeeping” genes that act as internal controls and normalization standards in each patient sample. The assay is performed on formalin fixed paraffin-embedded (FFPE) prostate cancer blocks. The assay results are reported as a numerical score along with accompanying interpretive information.

The Prolaris test report that is delivered to the ordering physician includes:

- The patient’s Prolaris Score (i.e. cell cycle progression score or “CCP”);
- The patient’s estimated 10-year prostate cancer mortality risk based on his Prolaris Score in combination with his
- CAPRA score (the combined clinical-cell-cycle risk score, or “CCR”);
- A depiction of a threshold for prostate cancer mortality risk below which active surveillance may be safely considered.

The active surveillance threshold was developed based on the CCR score distribution in a training cohort of commercially tested men who might typically be considered for active surveillance according to national cancer guidelines, based on their clinical characteristics alone (n = 505). The training cohort included men meeting the following criteria: Gleason score $\leq 3+4$; PSA < 10 ng/ml; <25% positive cores; and T-stage $\leq T2a$ (N=505). A threshold for the CCR score of 0.8 was conservatively selected such that 90% of the men in the training cohort had scores below the threshold.

The threshold of 0.8 was then validated in two independent cohorts (combined n=765) of conservatively managed men with known outcomes for prostate cancer specific mortality (PCM). The Prolaris Score was a strong prognostic indicator in both validation cohorts, based on previous publications (See references 2 & 3). The threshold was able to dichotomize men into significantly different risk groups. There were no prostate cancer deaths in the group of men with CCR scores below the threshold of 0.8. The CCR score of 0.8 corresponded to a 10-year predicted risk of PCM of about 3%. In summary, the threshold for the CCR score of 0.8 distinguishes men with prostate cancer who may safely pursue active surveillance from those who may not be good candidates.

II. Criteria: CWQI HCS-0225

- A. Prostate cancer genomic assay (Prolaris™) is covered for men with prostate cancer with **ALL** of the following:
- Localized or biochemically recurrent adenocarcinoma of prostate (no clinical evidence of metastasis or lymph node involvement), **and**
 - FFPE prostate biopsy specimen with at least 0.5 mm of cancer length or FFPE tissue from a prostate resection specimen, **and**
 - Patient has an estimated life expectancy of greater than or equal to 10 years, **and**
 - Result will be used to determine treatment according to established standard practice guidelines, **and**
 - Patient has not received pelvic radiation or androgen deprivation therapy prior to the biopsy, **and**
 - Patient is monitored for disease progression according to established standard of care.

III. Information Submitted with the Prior Authorization Request:

- Chart notes
- Pathology report documenting clinical stage
- Laboratory reports

IV. CPT or HCPC codes covered:

Codes	Description
81541	Oncology (prostate), mRNA gene expression profiling by real-time RT-PCR of 46 genes (31 content and 15 housekeeping), utilizing formalin-fixed paraffin-embedded tissue, algorithm reported as a disease-specific mortality risk score
81479	Unlisted Molecular Pathology Procedure

V. Annual Review History

Review Date	Revisions	Effective Date
03/15/2018	New Criteria adopted from CMS Noridian LCD for Prolaris Prostate Cancer Genomic Assay (very low, low and intermediate risk) guideline	6/1/2018
03/27/2019	Annual Review: No changes	04/01/2019
03/25/2020	Annual Review: No changes	04/01/2020
03/24/2021	Annual Review: grammar update, no content change	04/01/2021
1/2022	Update: Prostate cancer genomic assay coverage requirements, L38341

Appendix 1 – Applicable Diagnosis Codes:

Codes	Description
C61	Malignant neoplasm of prostate

Appendix 2 – Centers for Medicare and Medicaid Services (CMS)

Medicare coverage for outpatient (Part B) drugs is outlined in the Medicare Benefit Policy Manual (Pub. 100-2), Chapter 15, §50 Drugs and Biologicals. In addition, National Coverage Determination (NCD) and Local Coverage Determinations (LCDs) may exist and compliance with these policies is required where applicable. They can be found at: <http://www.cms.gov/medicare-coverage-database/search/advanced-search.aspx>. Additional indications may be covered at the discretion of the health plan.

Medicare Part B Covered Diagnosis Codes (applicable to existing NCD/LCD):
